distribution of food losses. In the next sections the role of energy in post-harvest losses is discussed. Thereafter, the main entry points within the food value chain where lack of access to energy is the dominant factor influencing food losses is discussed. This report outlines low cost and off-grid post-harvest cooling and processing technologies that can be made available in developing countries. These household to community scale evaporative cooling systems, solar assisted cooling systems and as well as solar drying systems that can help increase shelf life. Additionally, through case studies, focus is laid on assessing the technical and economic feasibility of cooling and processing technologies. Finally, recommendations are made that could be incorporated to further develop food loss strategies that can classify food value chains based on their

energy demand. This will enable policy makers to quickly understand the main technologies for food preservation and processing that can be introduced based on the available energy sources in a given region.

Air Pollution Modeling and its Application

XVIII Carlos Borrego
2011-09-22 Recent developments in air pollution modeling are explored as a series of contributions from researchers at the forefront of their field. This book on air quality modeling and its applications is focused on local, urban, regional and intercontinental modeling, data assimilation and air quality forecasting, model assessment and validation, aerosol transformation, the relationship between air quality and human health and the effects of climate change on air quality. It consists of a series of papers that were presented at the 28th NATO/CCMS Conference on Air

Pollution Modeling and its Application held in Leipzig, Germany, May 15-19, 2006. It is intended as reference material for students and professors interested in air pollution modeling at the graduate level as well as researchers and professionals involved in developing and utilizing air pollution models. *Discusses cutting-edge developments on air pollution modeling and air quality issues *Presents topical and highly relevant subjects to the air quality and modeling research community *Provides material that can be used to further improve air quality modeling and to inform the community about recent and novel developments in the field

Handbook of Downstream Processing E. Goldberg
2012-12-06 The last two decades have seen a phenomenal growth of the field of genetic or biochemical engineering and have witnessed the development and ultimately marketing of a variety of products—typically through the manipulation and growth of different types of microorganisms, followed by the recovery and purification of the associated products. The engineers and biotechnologists who are involved in the full-scale process design of such facilities must be familiar with the variety of unit operations and equipment and the applicable regulatory requirements. This book describes current commercial

practice and will be useful to those engineers working in this field in the design, construction and operation of pharmaceutical and biotechnology plants. It will be of help to the chemical or pharmaceutical engineer who is developing a plant design and who faces issues such as: Should the process be batch or continuous or a combination of batch and continuous? How should the optimum process design be developed? Should one employ a new revolutionary separation which could be potentially difficult to validate or use accepted technology which involves less risk? Should the process be run with ingredients formulated from water for injection, deionized water, or even filtered tap water? Should any of the separations be run in cold rooms or in glycol jacketed lines to minimize microbial growth where sterilization is not possible? Should the
