WIG Craft and Ekranoplan Liang Yun 2009-12-03 In the last half-century, high-speed water transportation has developed rapidly. Novel high-performance marine vehicles, such as the air cushion vehicle (ACV), surface effect ship (SES), high-speed monohull craft (MHC), catamaran (CAT), hydrofoil craft (HYC), wave-piercing craft (WPC) and small water area twin hull craft (SWATH) have all developed as concepts, achieving varying degrees of commercial and military success. Prototype ACV and SES have achieved speeds of 100 knots in at calm con- tions; however, the normal cruising speed for commercial operations has remained around 35-50 knots. This is partly due to increased drag in an average coastal s- way where such craft operate services and partly due to limitations of the propulsion systems for such craft. Water jets and water propellers face limitations due to c- itation at high speed, for example. SWATH are designed for reduced motions in a seaway, but the hull form is not a low drag form suitable for high-speed operation. So that seems to lead to a problem - maintain water contact and either water propulsion systems run out of power or craft motions and speed loss are a problem in higher seastates. The only way to higher speed would appear to be to disconnect completely from the water surface. You, the reader, might respond with a question about racing hydroplanes, which manage speeds of above 200 kph. Yes, true, but the power-to-weight ratio is extremely high on such racing machines and not economic if translated into a useful commercial vessel.

Thin-Walled Composite Beams Liviu Librescu 2006-01-15 Annotation This is the first monograph devoted to the foundation of the theory of composite anisotropic thin-walled beams and to its applications in various problems involving the aeronautical/aerospace, helicopter, naval and mechanical structures. Throughout the theoretical part, an effort was made to provide the treatment of the subject by using the equations of the 3-D elasticity theory. Non-classical effects such as transverse shear, warping constraint, anisotropy of constituent materials yielding the coupling of twist-bending (lateral), bending (transversal)-extension have been included and their implications have been thoroughly analyzed. Thermal effects have been included and in order to be able to circumvent their deleterious effects, functionally graded materials have been considered in their construction. Implications of the application of the tailoring technique and of the active feedback control on free vibration, dynamic response, instability and aeroelasticity of such structures have been amply investigated. Special care was exercised throughout this work to address and validate the adopted solution methodologies and the obtained results against those available in the literature and obtained via numerical or experimental means.

Biplanes at War Wray R. Johnson 2019-04-16 Unlike the relative uniformity of conventional warfare, the peculiarities of small wars prevent a clear definition of rules and roles for military forces to follow. During the small wars era, aviation was still in its infancy, and the US military had only recently begun battling in the skies. The US Marine Corps recognized that flexibility and ingenuity would be critical to the successful conduct of small wars and thus employed the new technology of aviation. In *Biplanes at War: US Marine Corps Aviation in the Small Wars Era, 1915-1934*, author Wray R. Johnson provides a riveting history of the marines' use of aviation between the world wars, a time in which young soldiers were volunteering to fly in combat when flying itself was a dangerous feat. Starting with Haiti in 1915, *Biplanes at War* follows the marines' aviation experiences in Haiti, the Dominican Republic, China, and Nicaragua, chronicling how marines used aircraft to provide supporting fires (e.g., dive-bombing) to ground troops in close contact with irregular opponents, evacuate the sick and wounded, transport people and cargo (e.g., to assist humanitarian operations), and even support elections in furtherance of democracy. After years of expanding the capabilities of airplanes far beyond what was deemed possible, the small wars era ended, and the US Marines Corps transitioned into an amphibious assault force. The legacy of the marines' ability to adapt and innovate during the small wars era endures and provides a useful case study. *Biplanes at War* sheds light on how the marines pioneered roles and missions that have become commonplace for air forces today, an accomplishment that has largely gone unrecognized in mainstream histories of aviation and air power.

Mechanical Vibration and Shock Analysis, Fatigue Damage Christian Lalanne 2014-05-12 Fatigue damage in a system with one degree of freedom is one of the two criteria applied when comparing the severity of vibratory environments. The same criterion is also used for a specification representing the effects produced by the set of vibrations imposed in a real environment. In this volume, which is devoted to the calculation of fatigue damage, Christian Lalanne explores the hypotheses adopted to describe the behavior of material affected by fatigue and the laws of fatigue accumulation. The author also considers the methods for counting response peaks, which are used to establish the histogram when it is not possible to use the probability density of the peaks obtained with a Gaussian signal. The expressions for mean damage and its standard deviation are established and other hypotheses are tested.
