**Molecular Biology of Metal Homeostasis and Detoxification** Markus J. Tamás 2006-07-07 One of the challenges faced by every cell as well as by whole organisms is to maintain appropriate concentrations of essential nutrient metals while excluding nonessential toxic metals. Toward that end, all organisms have developed mechanisms for metal homeostasis and detoxification to maintain metal levels within physiological limits. This book brings together current knowledge of the molecular basis of metal homeostasis and detoxification in various eukaryotic model systems, including yeasts, plants, and mammals. It focuses on the cellular systems controlling metal transport, intracellular distribution, and immobilization as well as on systems regulating metal-dependent transcription. In addition to environmental aspects (including phytoremediation), the book treats the pathophysiology of metal deficiency and overload in relation to disease.

**War, Peace, and Human Nature** Douglas P. Fry 2015-02-01 Have

humans always waged war? Is warring an ancient evolutionary adaptation or a relatively recent behavior--and what does that tell us about human nature? In *War, Peace, and Human Nature*, editor Douglas P. Fry brings together leading experts in such fields as evolutionary biology, archaeology, anthropology, and primatology to answer fundamental questions about peace, conflict, and human nature in an evolutionary context. The chapters in this book demonstrate that humans clearly have the capacity to make war, but since war is absent in some cultures, it cannot be viewed as a human universal. And counter to frequent presumption the actual archaeological record reveals the recent emergence of war. It does not typify the ancestral type of human society, the nomadic forager band, and contrary to widespread assumptions, there is little support for the idea that war is ancient or an evolved adaptation. Views of human nature as inherently warlike stem not from the facts but from cultural views embedded in Western thinking. Drawing upon evolutionary and ecological models; the archaeological record of the origins of war; nomadic forager societies past and present; the value and limitations of primate analogies; and the evolution of agonism, including restraint; the chapters in this interdisciplinary volume refute many popular generalizations and effectively bring scientific objectivity to the culturally and historically controversial subjects of war, peace, and human nature.

**Animal Signaling and Function** Duncan J. Irschick 2014-12-01 The diversity of animal signals has been widely documented, and the generality of animal signals also tantalizingly suggests that there are common mechanisms that have selected for their origin. However, while much progress has been made on some fronts, we still lack a general theory about why the diversity of signaling structures exist. Our compilation will directly address this gap by focusing on an exciting new arena of sexual selection, namely using functional approaches to

understand signaling. This approach is rooted in the idea that many signals are designed to transmit important functional information that is both important for issues of male quality (and hence male competition), and female choice. The increasing use of technology in sexual selection studies has enabled researchers to test whether signaling is either constrained by, or accurately transmits information about functional capacities. Further, in animals that fight vigorously, functional capacities such as endurance or strength may make the difference between winning and losing. This volume brings together a diverse collection of researchers who are actively investigating how function and signaling are related. These researchers use both a variety of methods and taxa to study animal signaling, and we believe that this integrative view is important to open up fresh vistas for why animal signals have evolved.

**Advances and Technical Standards in Neurosurgery** Concezio Di Rocco 2022-08-17 This book offers an update on several basic and clinical problems in neurosurgery compiled by internationally recognized experts. This multi-thematic volume will touch on a variety of topics: from the role of women neurosurgeons in the last hundred year of the specialty history, to the pathogenesis of spinal dysraphism, to the convection-enhanced delivery of intracerebral antineoplastic drugs in children, through a review of methods and applications. The intraoperative cerebral blood flow monitoring in neurosurgery will be also discussed, offering again a comprehensive review of contemporary technologies and emerging perspectives. As for the technical standards, the book will describe the multimodality approach to cerebral gliomas, the management of thalamic tumors, the intracavitary treatment of craniopharyngiomas, the long term results of spasticity treatments, the surgical treatment of spinal vascular malformations, the management of idiopathic and refractory syringomyelia, offering at the same time an update of peripheral nerve surgery. All the chapters have to be considered an advance in the relative fields, in cerebral pathophysiology and in clinical management. Approaching the issue of technical standards in the everyday clinical practice of neurosurgery, this book is of great interest for neurosurgeons, neurologists and orthopaedists.

Human Evolution Bernard Grant Campbell 1966 In this new fourth edition, Campbell has revised and updated his classic introduction to the field. Human Evolution synthesizes the major findings of modern research and theory and presents a complete and integrated account of the evolution of human beings. New developments in microbiology and recent fossil records are incorporated into the enormous range of this volume, with the resulting text as lucid and comprehensive as earlier editions. The fourth edition retains the thematic structure and organization of the third, with its cogent treatment of human variability and speciation, primate locomotion, and nonverbal communication and the evolution of language, supported by more than 150 detailed illustrations and an expanded and updated glossary and bibliography. As in prior editions, the book treats evolution as a concomitant development of the main behavioral and functional complexes of the genus Homo among them motor control and locomotion, mastication and digestion, the senses and reproduction. It analyzes each complex in terms of its changing function, and continually stresses how the separate complexes evolve interdependently over the long course of the human journey. All these aspects are placed within the context of contemporary evolutionary and genetic theory, analyses of the varied extensions of the fossil record, and contemporary primatology and comparative morphology. The result is a primary text for undergraduate and graduate courses, one that will also serve as required reading for anthropologists, biologists, and nonspecialists with an interest in human evolution. "Synthesizes the conventional academic thought into a textbook or detailed account for lay readers. Along the chronological

narrative are discussions of progress in homeostasis, the primate radiation, locomotion and the hindlimb, function and structure of the head, reproduction and social structure, and culture and society." Book News Bernard Campbell has been a visiting lecturer at Harvard and Cambridge, and has taught and conducted research in Eastern and Southern Africa. He was professor of anthropology at the University of California, Los Angeles, from 1970-76. Dr. Campbell is author/coauthor of *Sexual Selection and the Descent of Man*; *Human Ecology* (second edition, Aldine); *Humankind Emerging* and the definitive three-volume *Catalogue of Fossil Hominids*.

**Nutrition and Science** John Nichols 2018-12-11 This book offers a completely up-to-date summary of nutritional medicine as it applies to frontline medical professionals, medical students and the interested layperson. Newspapers often give contradictory and confusing reports on issues such as alcohol intake, dietary sugars versus fats and the value (or lack thereof) of taking supplements. In addition, many GPs are as confused as their patients on these matters as they get very little education in nutrition either at medical school or afterwards. However, nutritional medicine is not really that confusing. There is some disagreement among experts, but there is a consensus on the most important issues, albeit with slight variations. The book summarises these generally agreed opinions, but explains where there are differences of opinion, detailing the reasons for these.

*Greenfield's Neuropathology Eighth Edition 2-Volume Set* Seth Love 2008-02-29 Greenfield's Neuropathology, the worlds leading neuropathology reference, provides an authoritative, comprehensive account of the pathological findings in neurological disease, their biological basis and their clinical manifestations. This account is underpinned throughout by a clear description of the molecular and cellular processes and reactions that are relevant to the development, and normal and abnormal functioning of, the nervous system. While this scientific content is of paramount importance, however, care has been taken to ensure that the information is presented in a way that is accessible to readers working within a range of disciplines in the clinical neurosciences, and that also places the neuropathological findings within the context of a broader diagnostic process. The new eighth edition incorporates much new information, new illustrations and many new authors, while retaining the depth, breadth and quality of content so praised in previous editions. Each chapter opens with an introductory section designed to offer an integrated approach to diagnosis, taking account of clinical manifestations, neuroradiological and laboratory findings as well as the neuropathological and molecular genetic features of the diseases being considered. Strong emphasis has been placed on facilitating the retrieval of neuropathological information by non-neuropathologists grappling with differential diagnoses or seeking information on broad categories of neurological disease, and boxes and tables are used to present important symptoms and signs, patterns of disease and other features for ease of reference. High quality line and photographic illustrations, the majority in full colour, are all available on a companion CD, to complete the offering.

**Active Learning in Secondary and College Science Classrooms** Joel Michael 2003-10-17 The working model for "helping the learner to learn" presented in this book is relevant to any teaching context, but the focus here is on teaching in secondary and college science classrooms. Specifically, the goals of the text are to: \*help secondary- and college-level science faculty examine and redefine their roles in the classroom; \*define for science teachers a framework for thinking about active learning and the creation of an active learning environment; and \*provide them with the assistance they need to begin building successful active learning environments in their classrooms. Active Learning in Secondary and College Science Classrooms: A Working Model for Helping the Learner to Learn is motivated by fundamental changes in education in response to perceptions that students are not adequately acquiring the knowledge and skills necessary to meet current educational and economic goals. The premise of this book is that active learning offers a highly effective approach to meeting the mandate for increased student knowledge, skills, and performance. It is a valuable resource for all teacher trainers in science education and high school and college science teachers.
